

Chapter 3: Our Transportation System Today

Baseline Multimodal Infrastructure, Asset Management, and Operational Performance

Executive Summary: Existing Conditions Assessment

Chapter 3 evaluates the current physical condition and operational performance of the Tri-Cities region's multimodal transportation system. This comprehensive inventory provides the baseline data needed to identify congestion bottlenecks, safety hazards, asset deficiencies, and transit service gaps.

Key Findings: Transportation System Today

- **Roadway Network:** The region encompasses over 1,200 centerline miles of roadway, anchored by major interstate corridors (I-95, I-85, I-295) and regional arterials (US 1, US 301, US 460, Route 10, Route 36).
- **Bridge Conditions:** Over 92% of National Highway System (NHS) bridge deck area is in Good or Fair condition; however, several aging structures on secondary routes require priority rehabilitation.
- **Transit Service:** Petersburg Area Transit (PAT) operates fixed-route bus services connecting Petersburg, Hopewell, Colonial Heights, and Fort Gregg-Adams. Express bus and vanpool options provide commuter connections to downtown Richmond.
- **Active Transportation:** The Appomattox River Trail (ART) serves as the regional spine for bicycle and pedestrian travel, with critical connector segments currently under development.
- **Freight Corridors:** Major rail lines operated by CSX and Norfolk Southern, alongside interstate highways, handle millions of tons of domestic and international cargo annually.

The complete, detailed technical report for Chapter 3 is currently undergoing final interagency review. The full chapter will include comprehensive pavement condition ratings, level of service (LOS) analysis for all major intersections, transit ridership profiles, and freight bottleneck locations.
